Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was pCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 985608-986759, 1101192-1101959, and 1217928-1220615). Subtraction by Bento Soares and M. Fatima Bonaldo. " a 31 c 61 g 53 t

Localization of a new prostate specific antigen-related serine
protease gene, KIK4, is evidence for an expanded human kallikrein
(KLK) gene family cluster on chromosome 19q13.3-13.4

On May 27, 1999 this sequence version replaced gi:4741461.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coll, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments. Unfinished: dJ310013 Contig_ID: 00252 acc=AL031658

```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send an E-mail to egreen@nhgri.nih.gov

This clone is from the first release of the human BAC library. The library contains cloned DNA from a human male fibroblast cell line 9785K. For references see: Shizuya et al., Proc. Natl. Acad. Sci. 89:8794-8797 (1992); Kim et al., Genomics 34:213-218 (1996). VECTOR: pBELO

NEIGHBORING SEQUENCE INFORMATION:
Actual start of this clone is at base position 1 of H_RG030H15;
actual end is at 151770 of H_RG030H15. The orientation of this clone is unknown.

                                                                                                                                                                                                                                                                                                                                                                                                               complete
```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send mailto:egreen@nhgri.nih

SOURCE INFORMATION: This clone is from the first BAC library from Genome (http://www.genomesystems.com). Systems,

                                                                                 Sequence Quality Assessment:
This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.

Unmatched fragments are due to vector-containing sequences. We expect 3, 1 and 1-2 such fragments in the BgIII, ECORI, and NsII enzyme domains, respectively. The sum of these fragments can be calculated from the sequence of the BAC clone and, in this clone, should be 26,152bp, 9,439bp, and 25,563bp for the three enzyme domains.

                                                                                                  Human DNA sequence from clone 30M3 on chromosome 6p22.1-22.3. Contains three novel genes, one similar to (predicted) plant, worm, yeast and archaea bacterial genes, and the first exon of the KIAA0319 gene. Contains ESTs, GSSs and putative CpG islands, complete sequence.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1597

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      On Dec 29, 1998 this sequence version replaced gi:4007165. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence is the entire insert of clone 30M3.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence was generated from part of bacterial clone contigs human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chf 1000 the library RPCII constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. On Jul 31, 1998 this sequence version replaced g1:3242678.
Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AC004024

Result Title: Perfect score: Database Searched: Scoring table: o 0 0 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. The present sequence is a new DNA which encodes an immunogenic portiof a prostate tumour protein. The encoded immunogen, or the DNA itsection be used as a vaccine for the treatment of prostate cancer The E was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

Pr Novel human prostate specific tumour protein and fragments - useful pr for detecting and treating prostate cancers

PS Claim 1; Page 113-114; 141pp; English.

CC This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as canced by this sequence). An antibody which binds to an immunogenic cortion of the prostate protein, and the method can be used to detect, consolitor progression of, or treat prostate cancers. The antibody may calso be conjugated to a therapeutic agent for use in therapy of prostate cancers.

The present sequence is a new DNA which encodes an immunogenic port. of a prostate tumour protein. The encoded immunogen, or the DNA its, can be used as a vaccine for the treatment of prostate cancer. The was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  weight disorders, e.g. obesity, cachexia or anorexia nervosa, or a related disorder such as diabetes. The products can also be used to modulate cell cycle progression and apoptosis. They can be used for treating neurodegenerative diseases which are characterised by apoptosis, including Alzheimer's disease, Parkinson's disease, Huntington's chorea, amylotrophic lateral sclerosis or spinocerebellar degenerations. The products can also be used for detection, diagnosis and drug screening.
